

Client Portal

1.33 Release

Overview

Feature Summary

1. Observable Error Fix
2. Worker Module – Remove Site Access Keys (Multiple Remove)

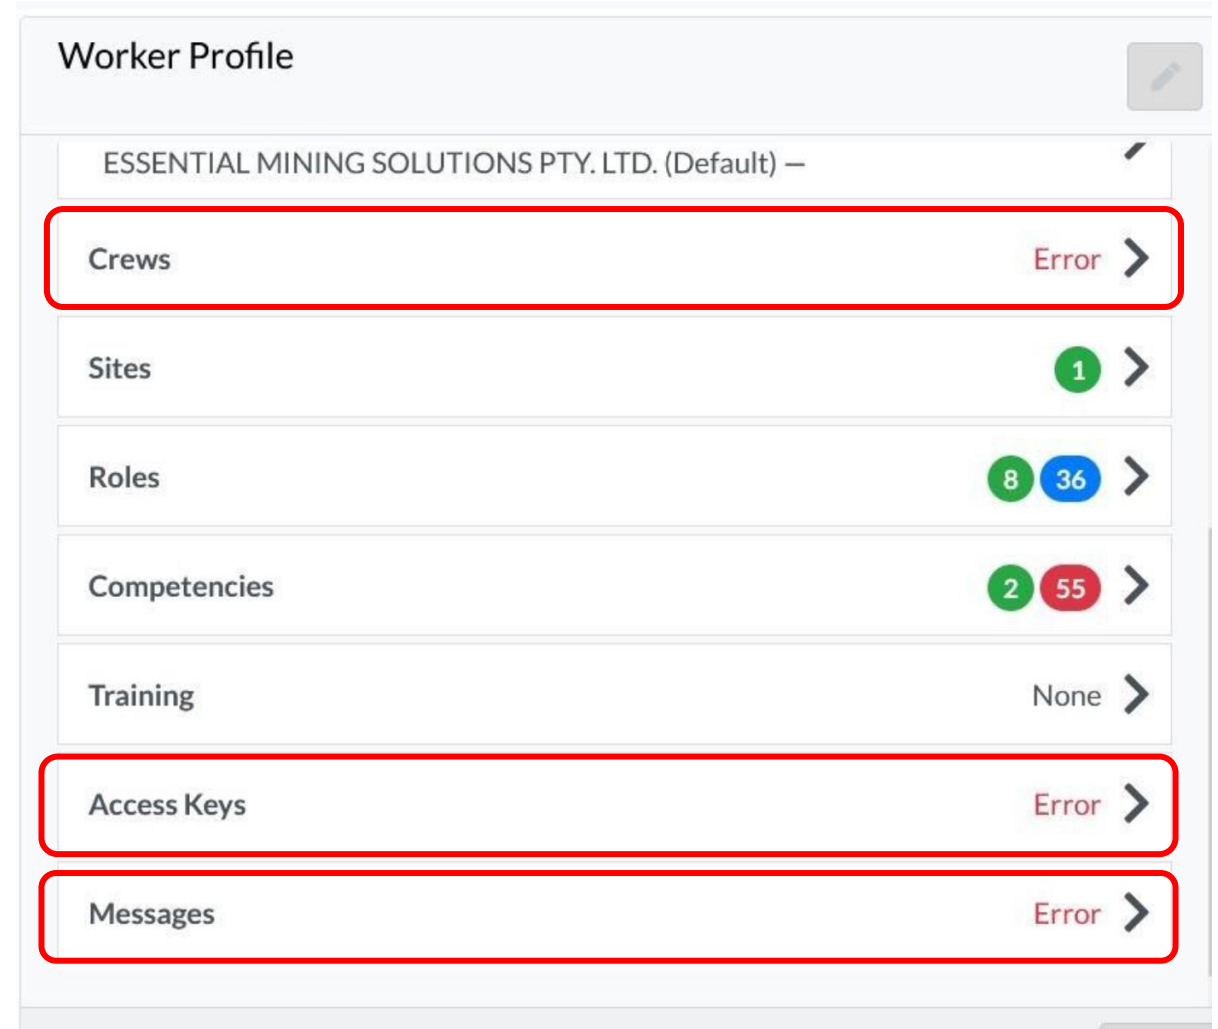

1. Observable Error

Problem: Randomly, after clicking on a Worker's profile an error shows on the competencies, crews, roles, access keys, messages chip. If the page is refreshed the error is cleared and the user can view these sections.

Error Message: Observable cancelled prematurely

Resolution: The code responsible for the error is deemed 'old' and therefore a lot harder to maintain. We have improved the overall code quality by refactoring the Competencies, Access Keys, Crews, Training, Roles and Messages components in the Worker Module to eliminate this error. This refactor promotes a simple coding style instead of the previous complicated coding.

This fix resolves 15+ Customer Support Requests.

2. Worker Module – Remove Site Access Keys (Multiple Remove)

1. Remove Multiple Site Access Keys from a Worker's Profile by selecting the Bulk Remove icon

2. Select the Worker's Site Access Keys you want to remove then click the Remove Button

3. An ADMIN NOTE will automatically be saved if you answer 'YES' to the Warning Pop Up Message
